

makers state that it is one of the best devices ever invented for filing papers, letters, vouchers or other kinds of documents, and, as shown in the accompanying illustration, is always ready for use. The "Little Midget" Binder is designed for fastening papers and light fabrics together, and is largely used by clothing, cloak and suit, straw braid, lace, neckwear, embroidery and other manufacturers in

preparing their lines of samples. It is automatic in action and holds 100 tinned steel wire staples, of which there are two sizes. These staples sell for 25 cents per 1,000.

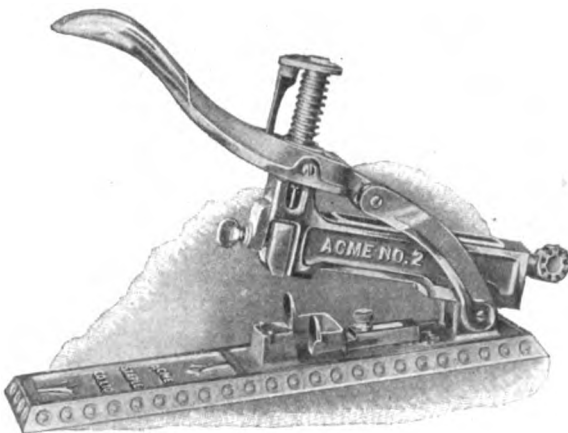

The Acme No. 1 Binder is a much heavier machine than either of the two former, and is intended for heavy office work. It is also much used for fastening together samples of carpets, woolen goods and other materials where

USEFUL OFFICE ACCESSORIES.

IN almost every office it is often necessary to fasten a number of sheets together, and there are many devices upon the market which perform this simple but very necessary work in a more or less satisfactory way. Among them is the fastener or hand stapling machine, which uses thin flat or round wire staples and still holds a leading

position, especially when stability and permanency is required, both by reason of their low cost, quickness and simplicity in operation. The Acme Staple Company is manufacturing and marketing a line of these machines which they claim are giving satisfaction wherever used.

Their leader, which is known as the Acme No. 2, drives a broad, flat staple, which will hold without tearing the thinnest or penetrate the toughest or hardest paper, and the

strength and permanency is required. It holds 100 one-quarter or 5-16-inch staples, and the manufacturers claim that the machine will not clog or buckle and that it will work perfectly in all kinds of goods. The accompanying illustration gives a very good idea of the appearance of this machine which, if desired, can be fastened to a shelf or table. The manufacturers call attention to another machine of this class which they state has met with considerable favor with many who have large quantities of work of this nature to be done and which they are marketing under the name of the "Sure Shot" Binder. This machine will bind any fabric up to one quarter inch in thickness, is substantially built, and is equipped with the same anti-clogging device as those previously described. All machines are regularly furnished with a neat Japan finish, but can be supplied handsomely nicked at a slight additional cost. Further particulars, together with prices and discounts, will be sent to all interested who will address the Acme Staple Company, Ninth and Market Streets, Camden, N. J., U. S. A.
